No BS. Just good old fashioned Customer Service

DX-35CP - DX-65CP - DX-130CP Counterpoise

- 1. Connect ring terminal on jumper to the screw on the bottom of the HFJ-350M**
- 2. Determine operating frequency and calculate 1/4 wave length**
- 3. Un-spool approximately 1/4 wave length of wire based on your operating frequency ($234/\text{Frequency in Mhz}$) and stretch the wire out from the radio along the ground or from a table or other operating position to a tree, bush fence etc. Length is approximate and will have to be adjusted until desired results are achieved.**
- 4. Attach the alligator clip to the DX-xxCP at the spool and leave the spool of excess wire next to the radio.**
- 5. Enjoy.**

Note: DO NOT touch counterpoise or let counterpoise touch the radio while transmitting.
